

Project 3 Name: SideQuest

Team Members: @James Jacob, @Melissa Rejuan

Description: Many students have ideas for side projects but struggle to find collaborators with the right technical skills, interests, or availability. Existing platforms like LinkedIn and GitHub are useful for professional networking and code hosting, but they are not designed to help students discover project opportunities and build teams around new ideas. SideQuest is a full-stack web application that connects students looking to collaborate on projects outside of the classroom. Users can create project listings, build personal profiles highlighting their technical skills and interests, browse available projects, and request join teams that match their experience. The following CRUD features will be implemented: **Create:** users create accounts, build personal profiles, create project listings, and request to join project teams, **Read:** users browse project listings, search and filter projects by category or required skills, view project details, browse user profiles, and view project teams, **Update:** users edit their profiles, update project information, modify project recruiting status, and project owners accept or decline team requests, and **Delete:** users delete project listings, withdraw team requests, leave project teams, or delete their accounts.

User Personas:

Peter, aspiring entrepreneur: Wants to turn a side project idea into reality by finding teammates with complementary skills. He needs a way to create project listings, specify required skills, manage incoming team requests, and build a project team.

Sadie, student: Wants to gain experience and build a portfolio for her resume as she seeks internships. She also wants to meet other students by contributing to interesting projects. She needs a way to browse available projects, search by technologies or interests, request to join projects, and manage current team memberships.

User Stories:

As Peter, I want to create a project listing describing my idea, required skills, desired team size, and open project roles so I can recruit collaborators.

As Peter, I want to edit my project's details, update its recruiting status, and manage incoming team requests so I can build my ideal team.

As Peter, I want to review incoming requests and accept or decline new team members so I can build an effective team.

As Sadie, I want to browse and filter projects by category, technology, and difficulty so I can find projects that match my interests.

As Sadie, I want to request to join a specific project role and include a short message describing my skills and experience so the project owner can determine whether I am a good fit.

As Sadie, I want to edit my profile, technical skills, interests, and availability so other users can better understand my background.

Work Distribution:

Melissa:

- User Profiles
 - Create user profiles (users collection)
 - View user profiles
 - Edit profile information
 - Update technical skills and interests
 - Manage availability status
 - Delete accounts
- Authentication
 - User registration
 - User login/logout using Passport
 - Session management
 - Protected routes

James:

- Project Listings
 - Create project listings (projects collection)
 - Browse all projects
 - Search and filter projects
 - View project details
 - Edit project information
 - Delete project listings
 - Update recruiting status
- Team Membership Management (teams_membership collection)
 - Request to join projects
 - Review join requests
 - Accept or decline team members
 - Leave a project team

- View current team members

Shared Responsibilities:

- Dashboard
 - View projects created by the user
 - View joined projects
 - View pending join requests
 - Manage recruiting projects
 - Display active and completed projects
- Database schema design
- MongoDB Atlas setup
- Generate synthetic data
- Application styling and responsive design
- Testing and debugging
- Deployment
- Documentation and README
- Presentation and demo video

Technology Stack

- **Frontend:** React with Hooks, React Router, HTML5, CSS Modules, and React Bootstrap for selected accessible interface components.
- **Backend:** Node.js and Express.
- **Database:** MongoDB Atlas using the native MongoDB Node.js driver. Mongoose will not be used.
- **Authentication:** Passport.js with Passport Local, bcrypt for password hashing, Express Session, and MongoDB-backed session storage.
- **Data Requests:** Fetch API.
- **Development Environment:** Vite with a development proxy for communication between the React frontend and Express backend. Axios and the CORS package will not be used.
- **Code Quality and Formatting:** ESLint, Prettier, and PropTypes.
